Outline for the afternoon

2:00-2:20	Lean Startup -- Nothing Here Is New	20m
2:20-2:30	Briefing	10m
2:30-3:00	Assumptions Workshop	20m
	Group Discussion	5m
	Points to Note	5m
3:00-3:30	Experiment Design Workshop	30m
3:30-4:00	BREAK	30m
4:00-4:30	Group Discussion (experiment design)	10m
	Smallify the Experiment	15m
	Points to Note	5m
4:30-5:00	MVP Workshop	30m
	Group Discussion	10m
	Points to Note	5m
5:00-5:30	7 habits, 4 power tools, 1 fishbowl	30m

Lean Startup?

Lean Startup is NOT

Cheap Startup

Fast Startup

Shortcut Startup

Lean Startup is NOT

Low-Ambition

Lean Startup is NOT

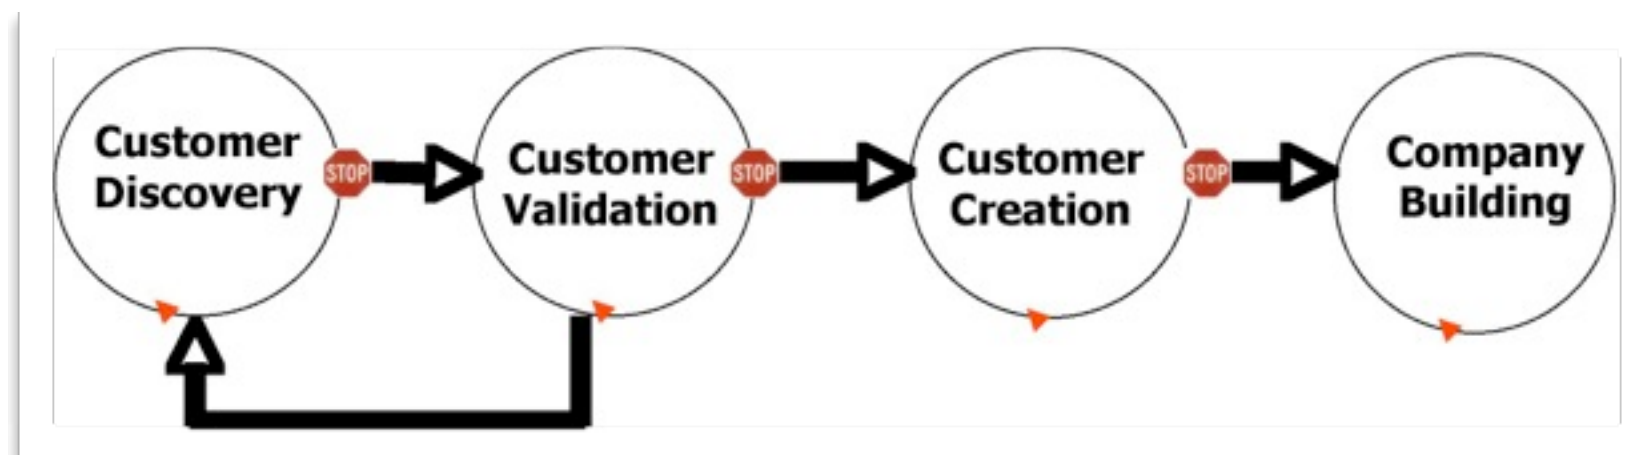

THE OPPOSITE OF FAT STARTUP

Get out
of the
building!

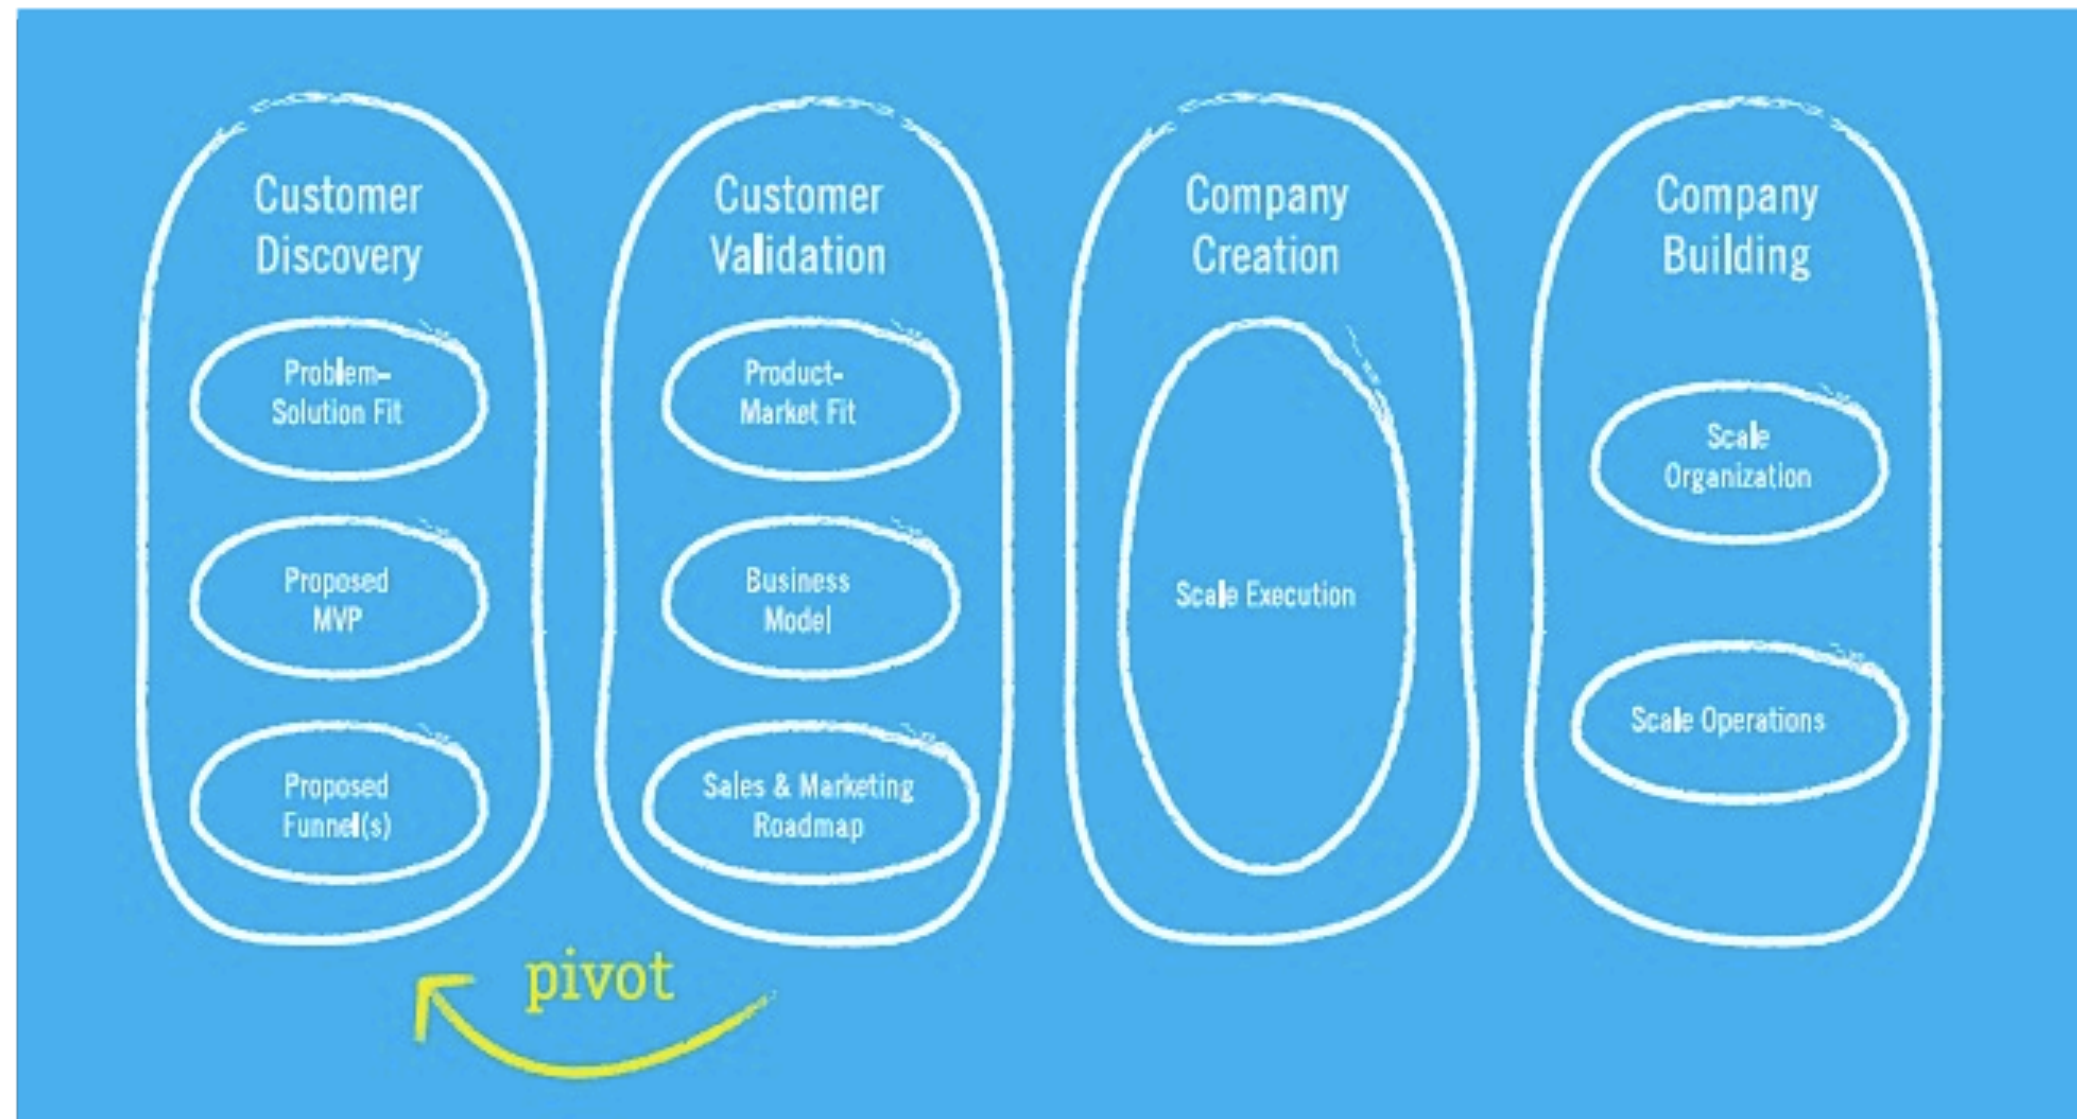

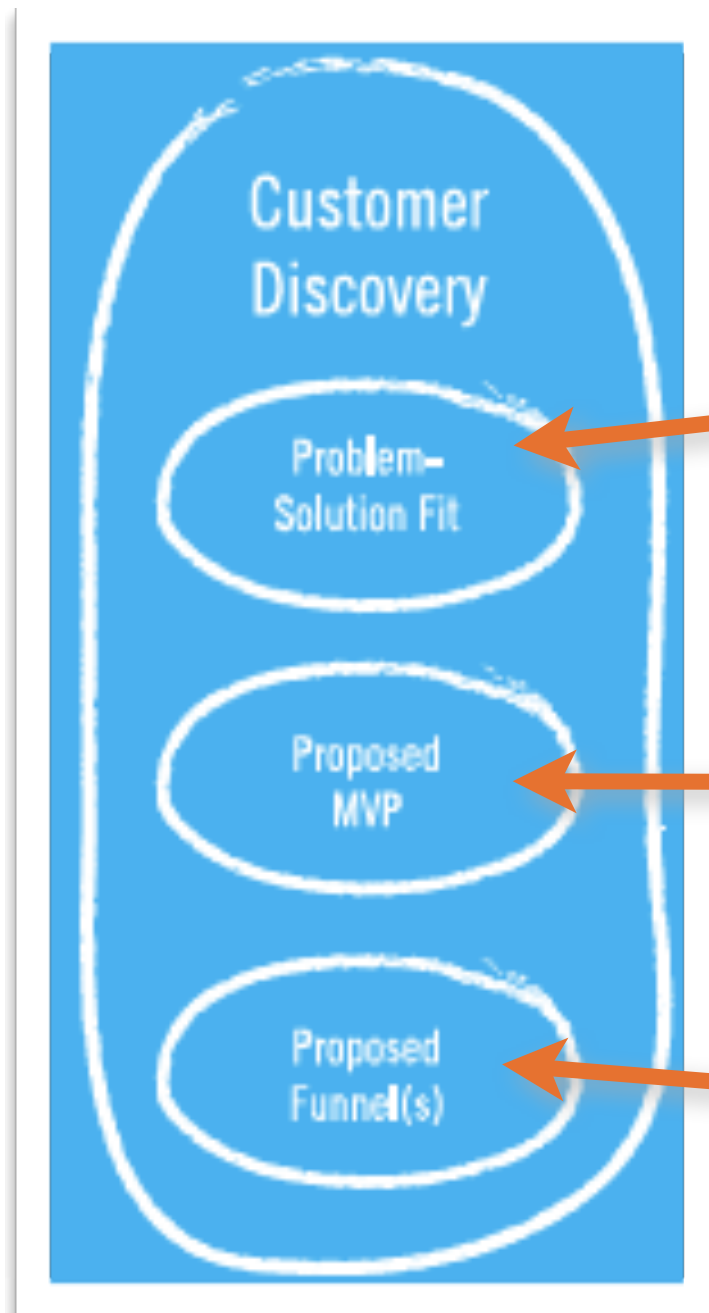

Steve Blank introduced “Customer Development” in...um...2006.

In 2010, Brant Cooper and Patrick Vlaskovitz wrote a shorter, more useful book.

**People, their
goals & needs**

**Sketches and
prototypes**

**“New user”
experiences**

**CUSTOMER DEVELOPMENT =
UX!?**

Google

"customer development"

Search

About 1,720,000 results (0.17 seconds)

[Advanced search](#)

About 1,720,000 results

Here's a distillation...

“Customer Development in 1 Page”

- * Who is it for?
(personas & Design target)
- * What can "MARY" do
that wasn't possible before?
(activity map, concept drawings)
- * What features does MARY need
for that?
(6-up drawings, stickies, 2x2)
- * How do they fit together?
(3-up, page-value prop, wireframes)

➔ The lean startup

I've been thinking for some time about a term that could encapsulate trends that are changing the startup landscape. After some trial and error, I've settled on the Lean Startup. I like the term because of two connotations:

107
tweets

retweet

1. Lean in the sense of low-burn. Of course, many startups are capital efficient and generally frugal. But by taking advantage of open source, agile software, and iterative development, lean startups can operate with much less waste.
2. The lean startup is an application of Lean Thinking. I am heavily indebted to earlier theorists, and highly recommend the books [Lean Thinking](#) and [Lean Software Development](#). I also owe a great debt to Kent Beck, whose [Extreme Programming Explained: Embrace Change](#) was my first introduction to this kind of thinking. (So far, I have found "lean startup" works better with the entrepreneurs I've talked to than "agile startup" or even "extreme startup.")

What are the characteristics of a lean startup? One that is powered by

Coming soon...

The [Lean Startup Book](#) will be published in Fall, 2011 by Crown. You can [pre-order here](#).

UX Cycles

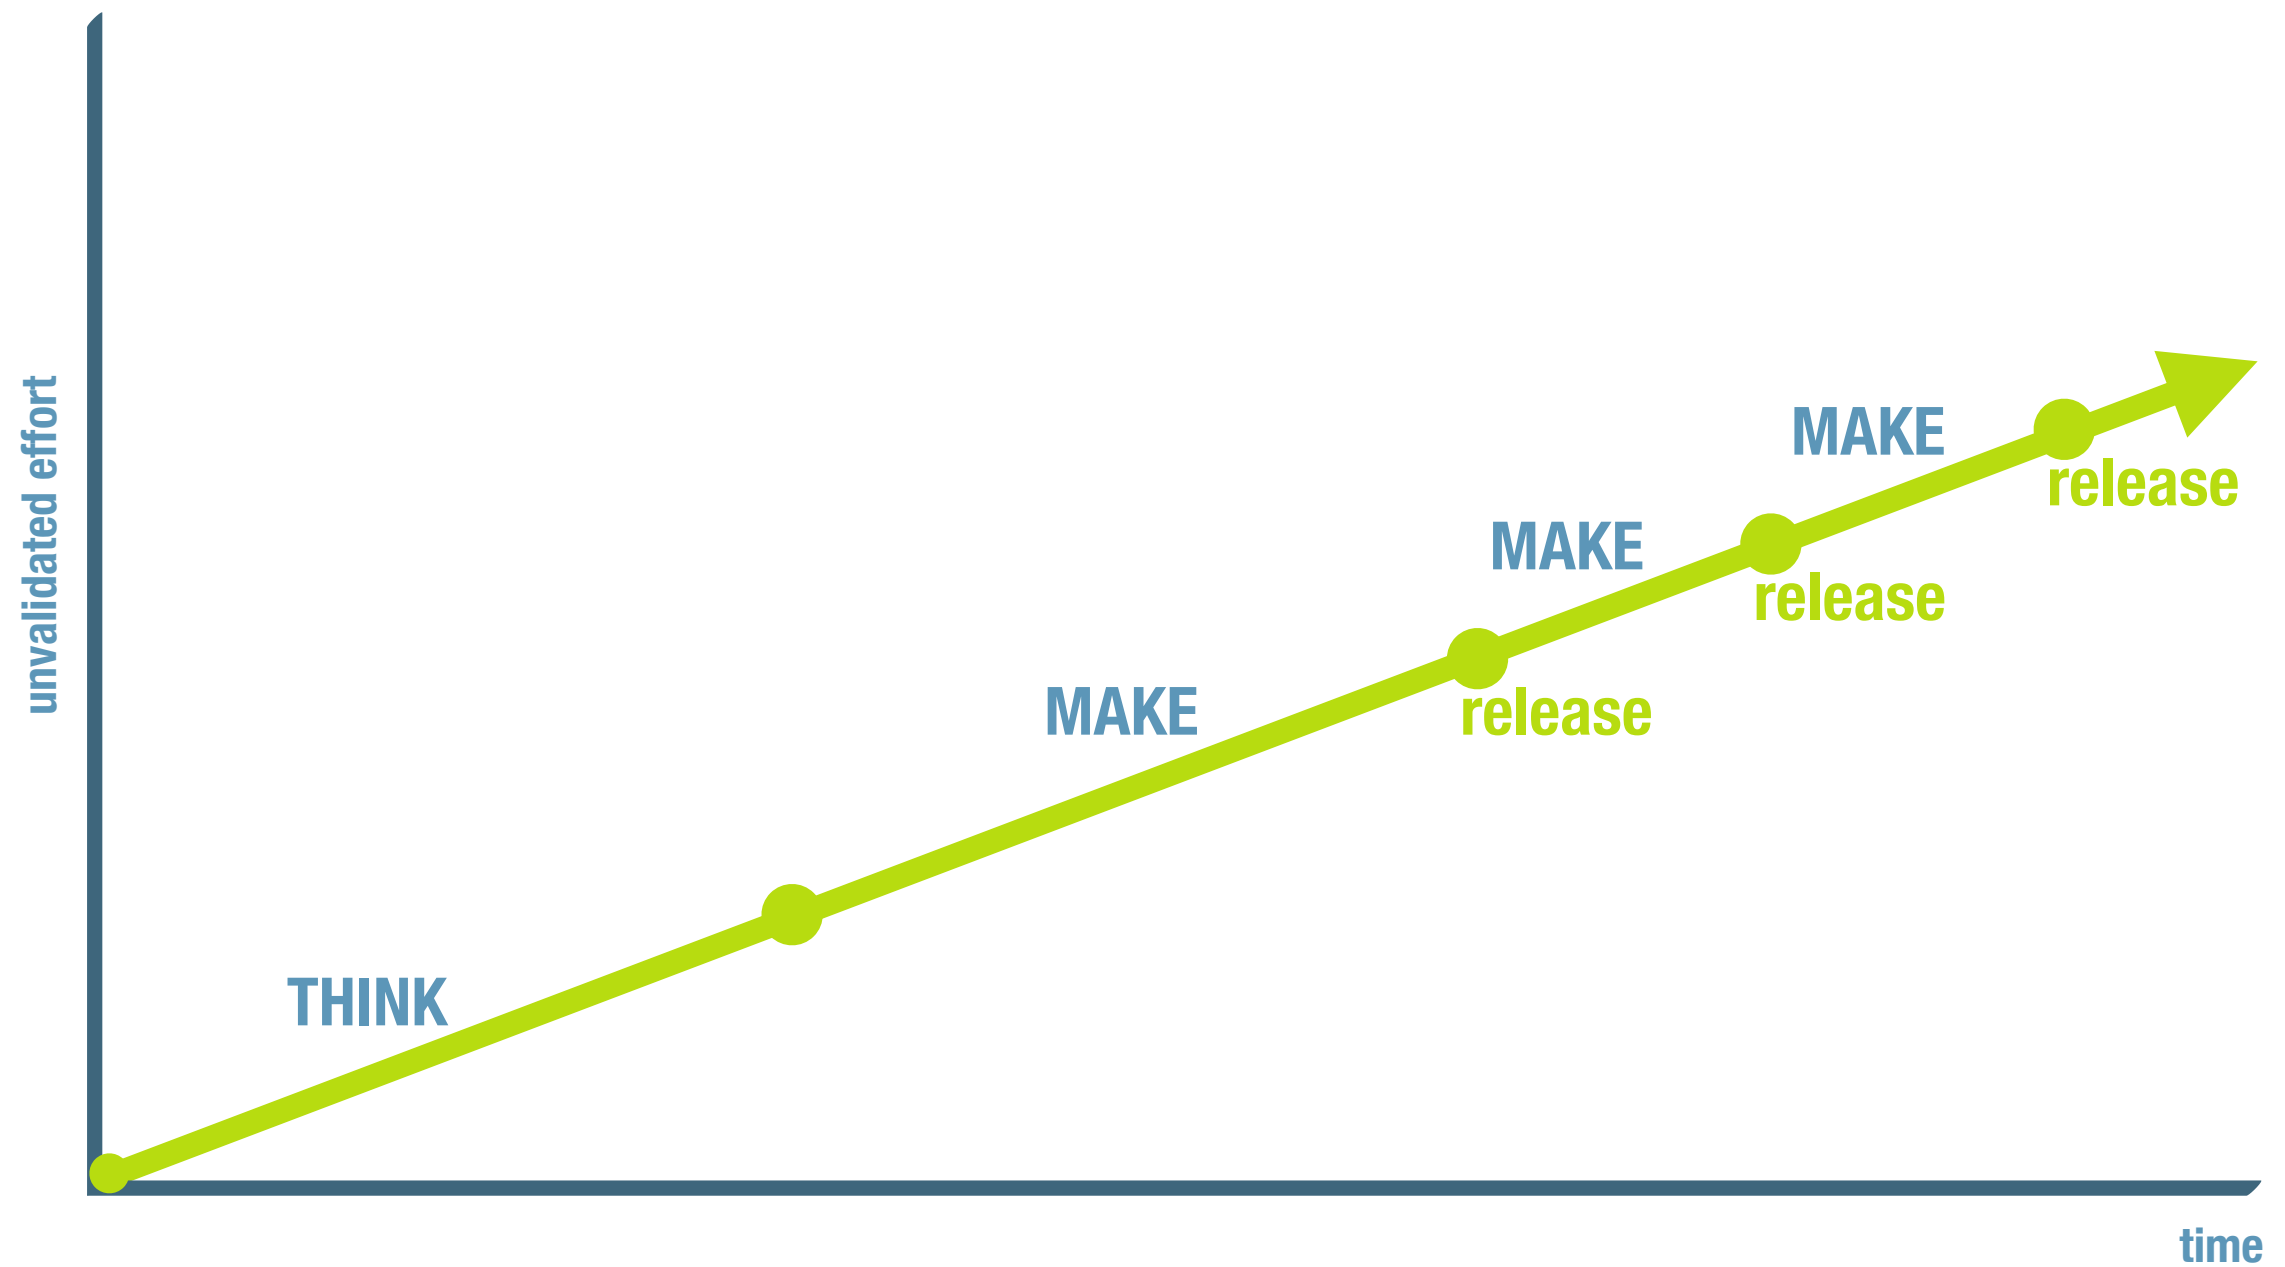

How does UX fit?

Among UX strengths...

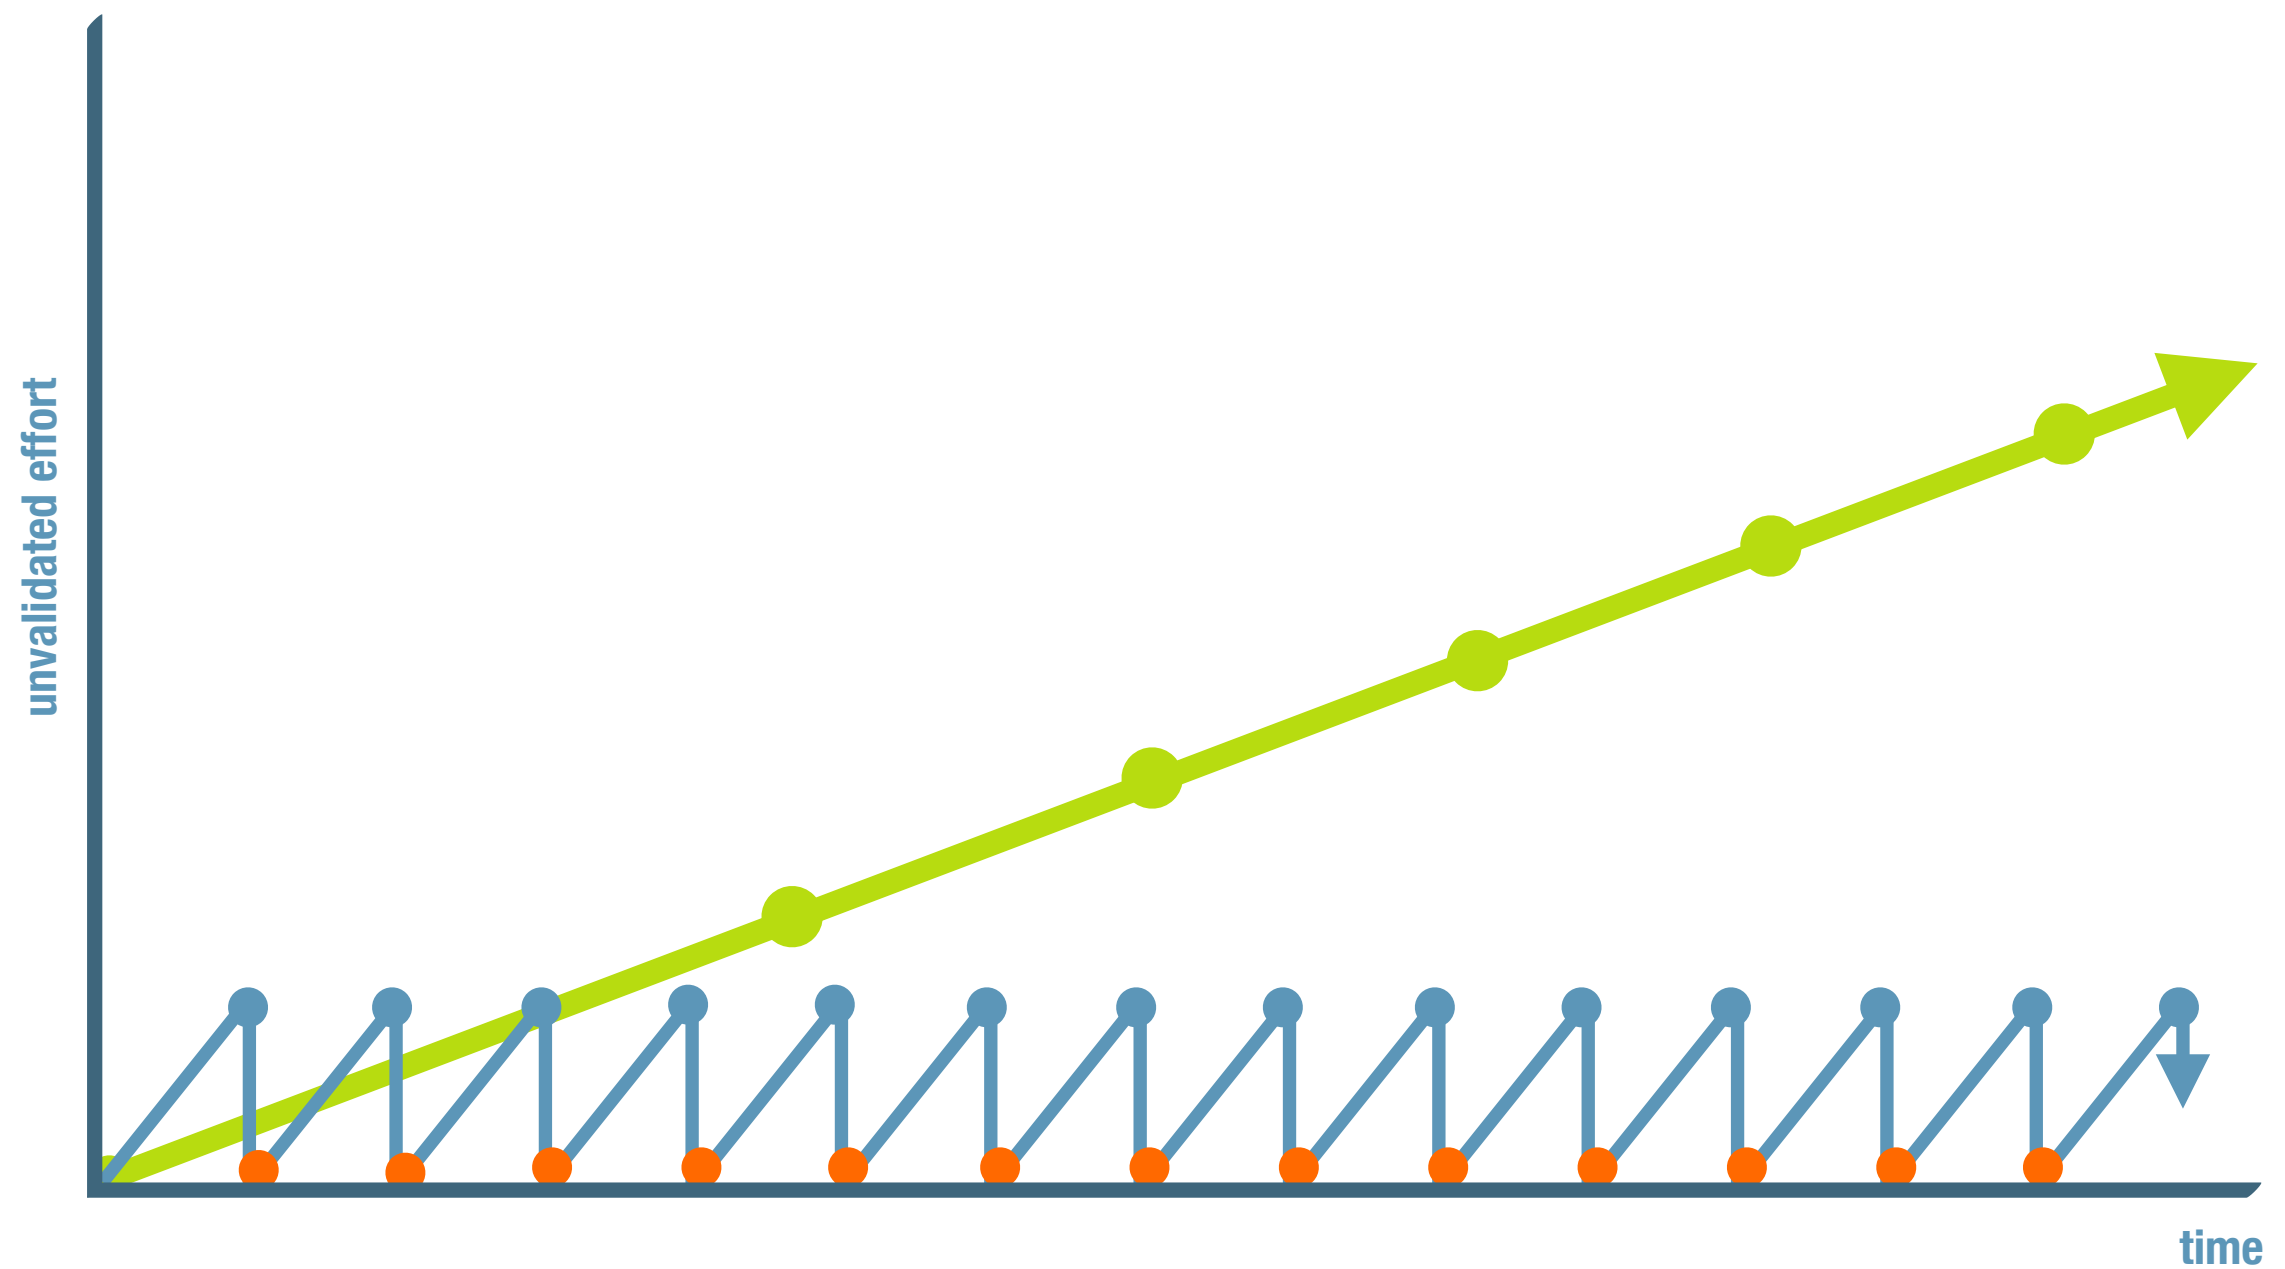

UX people are EXPERTS at “getting out of the building.”

Lean User Experience is a principle-driven process for teams working in situations of extreme uncertainty. It is characterized by practices that predispose predictable, high-quality, high-velocity user experience outcomes.

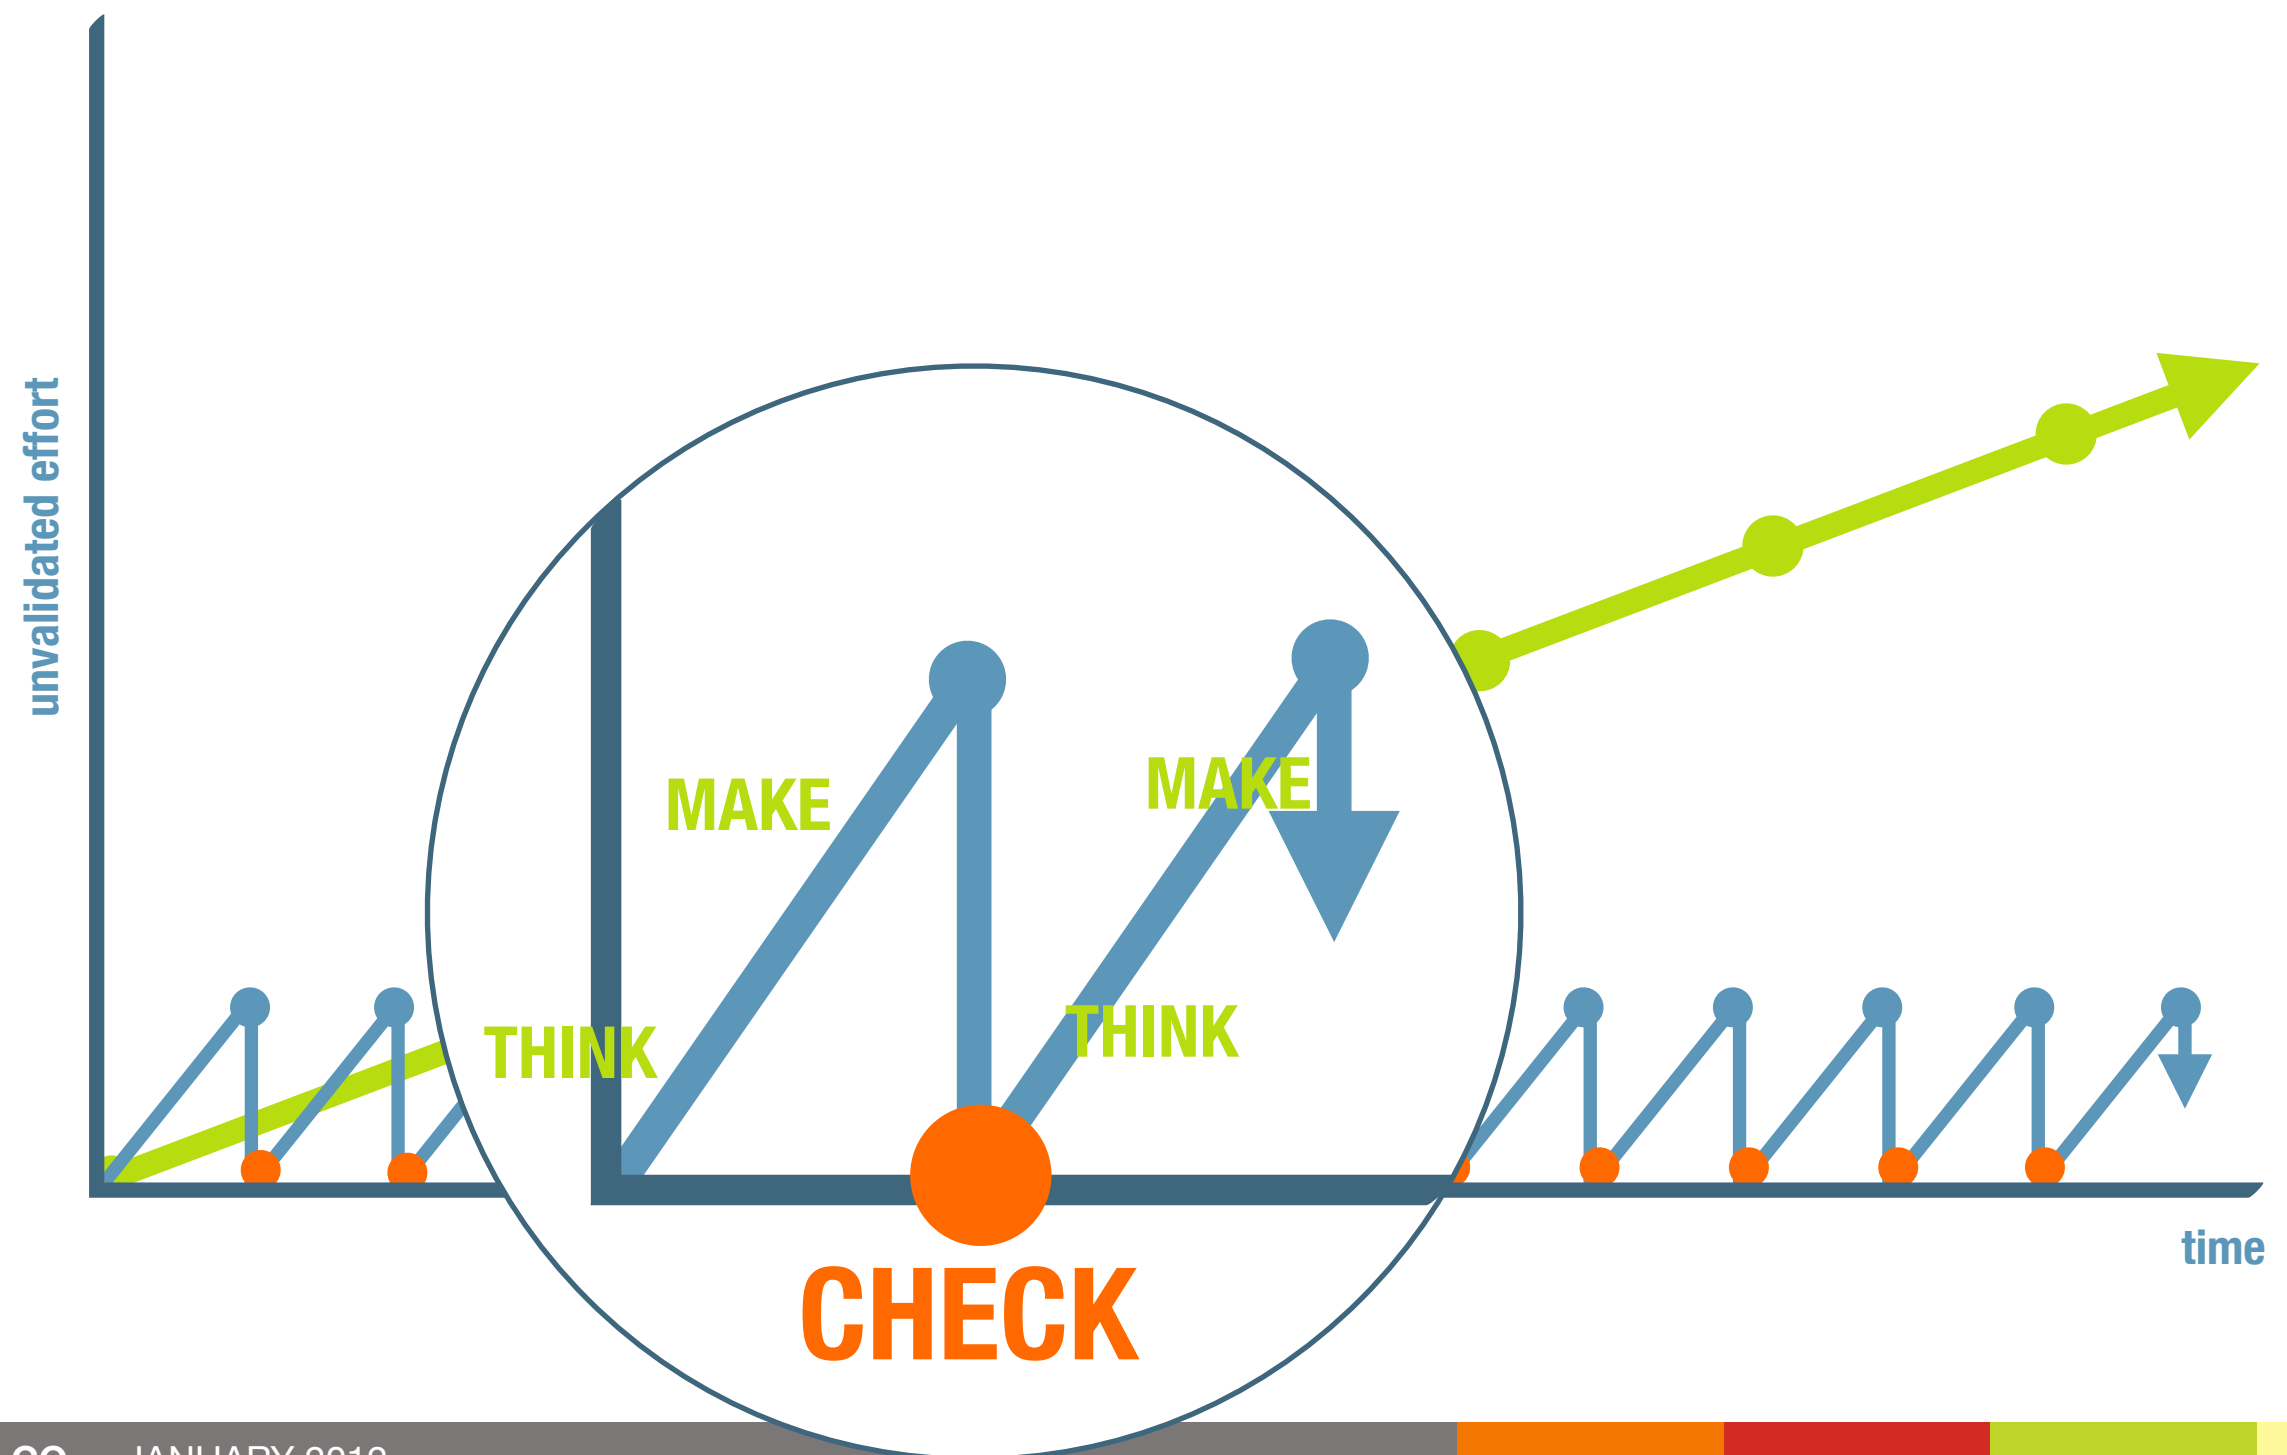

Plot the difference

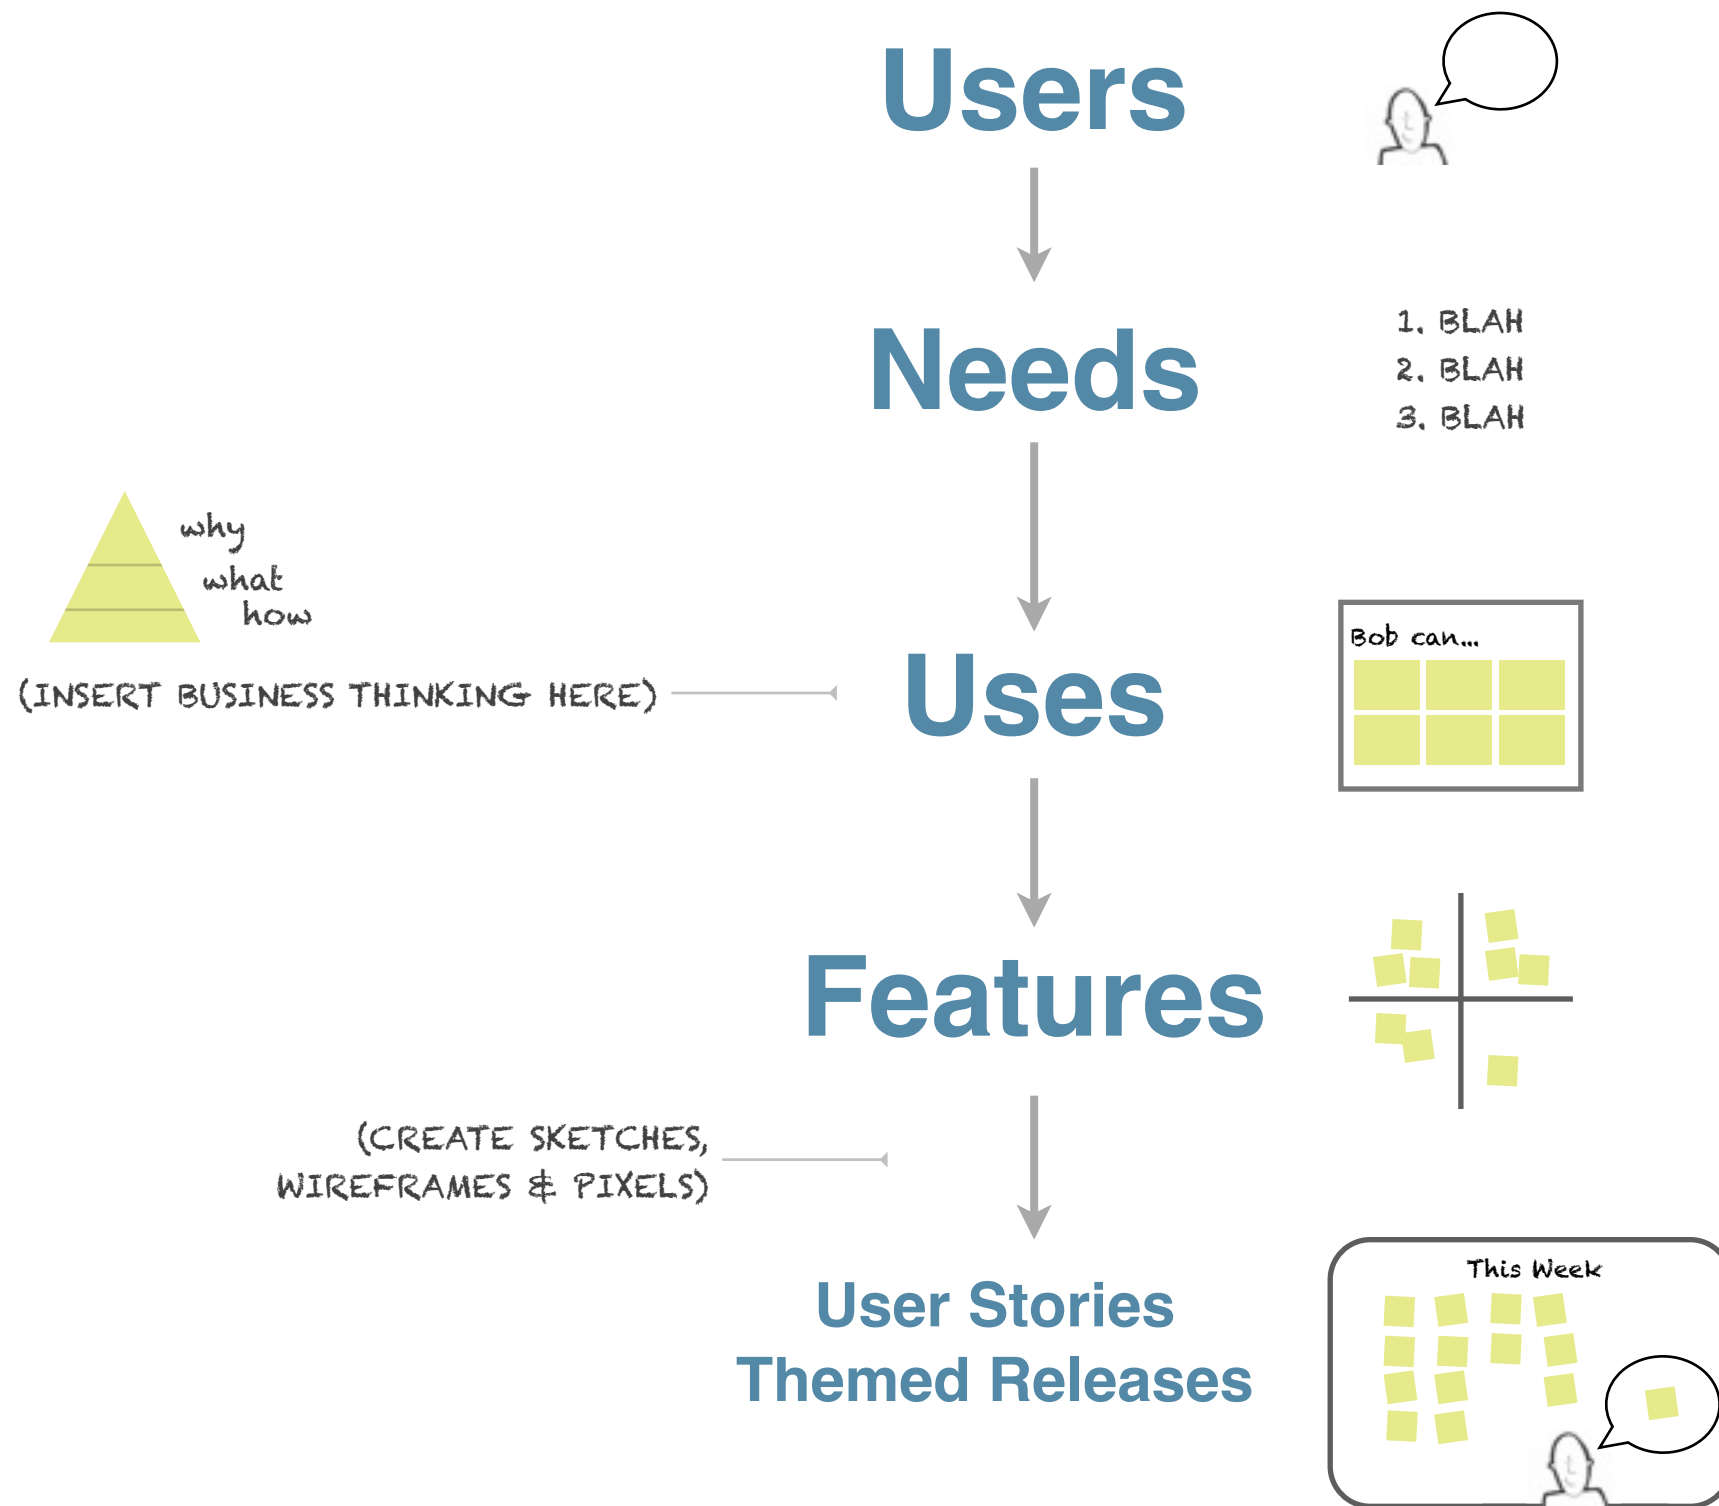

Lots of little wiggles

Each wiggle is a learning cycle.

MAKE THE RIGHT PRODUCT

**Victory is
measured in
learning.**

**This will change
how you think
about your role,
your work, your
team, your process.**

The setup.

“Reddy Runners”

Leah Fuskie was a developer at IBM. She was stuck at work one afternoon, and realized that she needed dogfood and wouldn't have time to get it.

Inspired by this need, Leah decided to start a marketplace where people with time could do odd jobs and errands for people who need help.

She put together a prototype marketplace where a person could post a job and name a price, and another person could make an offer to do that job.

“It's AirBnB for work, but with pricing arbitrage.”

As you can see from the “logo” above, she needs a good designer. She's a friend of a friend, and hired you to be the “rockstar” designer.

Congratulations!

You're the Cofounder of a new company.

Your partners are a pair of Software Engineers.

They raised enough money to pay everyone a small salary for 6 months, which means you have to start raising in 3 months.

You need to prove that this is a viable business by the time you go out to raise.

Ready? GO!

The job.

Assumptions

My assumption:

You don't want to waste your time, your career, your patience, or your friendship building something that has no chance of success.

Use a sharpie, work independently, write one idea per sticky.

Write down 10 assumptions that you & your team must validate in order to be sure the business idea is a good one.

Underline the one word or phrase that summarizes each assumption

Working at the wall, review all of the ideas as a team and de-dupe.

Discuss to understand.

Divide into 2 piles: Will it kill the company if we're wrong?

Stack Rank the top pile.

Choose the one assumption to move forward into the next step.

Examples

1. Many people will pay to have someone get dogfood or have odd jobs done.
2. People want to run errands like getting dogfood.
3. We believe it is legal in the country of operation
4. This service is useful for disorganized people.
5. This service is useful to time-poor people.
- 6.
- 7.
- 8.
- 9.
- 10.

Things to note about the assumptions workshop,

which you probably already knew,
that are massively valuable in a startup environment.

Broad ideation is mandatory in order to recognize which thoughts are the best.

Ideation can be quick if you focus, work independently, use paper and pen, and push yourself with a time limit.

Ideation applies to many parts of the logical thought process, not just feature identification and design.

Efficient decision-making is essential when you do broad ideation.

Decision-making is arbitrary when you have little or no data.

Multi-person ideation yields better thinking than solo ideation.

Multi-person ideation relieves pressure for anyone to be a “genius”.

Independent ideation, followed by group understanding, followed by decision-making is a uniquely efficient mode of decision-making.

Experiments

Work independently, use a sharpie and A4 paper.

At the top of the paper, state the hypothesis the team selected to move forward with.

Design an experiment to learn if this is true. Briefly describe it.

State how you will know if the hypothesis is valid or invalid. This can be quantitative evidence or qualitative.

How much time/money/effort will it take?

Do this 3x

Tape them all to the walls

Discuss as a group

Use three voting dots per person. Place them on the experiment frameworks that you find most appropriate given the circumstances.

Experiment Framework

We believe people like [customer type] have a need for (or problem doing) [need/action/behavior].

The smallest thing we can do to prove that need is [experiment].

We will know we have succeeded when [quantitative/measurable outcome] or [qualitative/observable outcome].

Smallification

Grab the three top experiments from dot-voting.

Take an experiment that was not your own and return to your table.

On a fresh sheet of paper, redesign the experiment:

WHAT WOULD YOU DO TO GET APPROXIMATELY THE SAME
LEARNING ... [each person on the team chooses one time scale]

IN 2 DAYS?

IN 2 WEEKS?

IN 2 MONTHS?

Discuss the experiments as a team.

Decide which experiment to run.

Experiments that were designed

assumption	experiment	measurable/observable outcome
busy people need a service to help them get menial shit done	fb ad, neighborhood targeting presents an offer, landing page. Phone number or tweet. No out of pocket cost.	10% ctr on ad, 10% ctr on landing page. 2 days
same	find busy people (in offices). Set up a "shop". Sit in their reception and see if we can get jobs. Prevail upon friend who runs 300-person company	5% of employees will make a hire. 1 repeat booking 2 wks
Similar	ad in 10 different offices, diff types of companies	2 weeks.

Things to note about the experiment & smallification workshops,

which you probably already knew,
that are massively valuable in a startup environment.

Progress not a function of the quality, size, or number of product releases.

Progress is measured in learning.

Smallification can be done by adjusting scope or fidelity.

Smaller/faster experiments are usually better.

Behavioral experiments are usually better.

Small, behavioral experiments are usually best.

Founders need to balance between size/quality and speed of learning.

The best option is often non-obvious.

The decision-maker is usually acting on belief, because there is insufficient data to decide rationally.

The decision-maker is therefore often going to be wrong.

Wrong decisions are expected and usually not fatal.

Progress is measured in sequential cycles of learning.

MVP

CUSTOMER

Mary
32 years old
Professional
Londoner
Married

PROBLEM

Mary needs more time, someone to catch her mistakes (left cell phone at the office), help cleaning the house, and help with ad-hoc temp work at the office.

SOLUTION

You've decided to focus on running errands like dry cleaning, small purchases like dog food, and picking up/delivering items.

Work independently using sticky notes & a sharpie, writing one idea per sticky.

Focus only on the Mary side of the marketplace. For now, you're going to use manual processes to handle the service fulfillment side.

Create 10 service/software features that should be created to support Mary's need.

Working at the wall, create a 2x2: Important/Not and Hard/Easy.

Place your stickies individually.

Remove the stickies below the line.

Together, stack rank the stickies on the right.

Decide where the cutoff is for the MVP.

Things to note about the MVP Workshop,

which you probably already knew,
that are massively valuable in a startup environment.

Product roadmaps are worse than useless in a startup.

On-time, on-budget delivery isn't helpful if you've built the wrong thing.

We're teaching entrepreneurs to anchor product builds in a single use that maps to a customer's need.

You should the smallest possible release to deliver on the use.

Releasing something unpolished or unfinished can make designers physically ill. Push yourself to rationally evaluate how much perfection is right for the circumstance.

Smallifying a product release is easier when you approach the question incrementally and stepwise.

Focusing on a small, single-use product makes it easier to envision and design.

We're not rejecting instinct and insight. You can get your imagined solution out on paper, set it aside, and understand it more rationally after going through a broad ideation process.

And now the big finish.

7 Habits of Highly Effective Startup Designers

1. Ideate with friends.
2. Go broad.
3. Say “Tell me about this one.”
4. Ask “who has the d?”
5. Make informed albeit arbitrary decisions.
6. Prove it.
7. Question perfection.

4 Power Tools for Startup Designers

1. Dump & Sort
2. Working at the Wall
3. Blue-tape 2x2
4. Dot-Voting
